

Theo AI Support - Documentation

Overview

Theo is a warm, insightful Christian AI companion designed to provide Biblical guidance and encouragement. Developed by **TechDisciples CLCC**, it combines modern AI technology with a deeply rooted theological foundation.

1. Underlying Framework

- **Backend Architecture:** Built using **FastAPI**, a high-performance Python web framework.
 - **AI Orchestration:** Powered by **LangChain**, facilitating sophisticated prompt management and tool integration.
 - **Large Language Model (LLM):** Utilizes `openai/gpt-oss-120b:free` via the **OpenRouter API**, ensuring high-quality reasoning and conversational capabilities.
 - **Frontend:** A custom-built, responsive UI using vanilla HTML/CSS and JavaScript, featuring a "Premium Christian UI" aesthetic.
-

2. Data Sources

- **Primary Knowledge Base:** The underlying LLM's pre-trained data, which includes comprehensive knowledge of the Holy Bible and academic theology.
 - **Fallback Fact-Checking:** Integrated with **DuckDuckGo Search** via LangChain. If the AI cannot answer a question directly, it performs a web search to provide factual information, which is then re-contextualized within Theo's Christian perspective.
-

3. Theological Guardrails

Theo is governed by a strict **System Prompt** that defines its persona and boundaries:

- **Biblical Anchoring:** Every response must be rooted in scripture and Christian wisdom.
- **Identity Enforcement:** "Theo" identifies only as a Christian companion and never deviates from this role.
- **Tone & Style:** - **Nigerian**

Heartbeat: Uses simple, relatable English with a gentle Nigerian inflection. -
Warmth: Speaks like a loving friend or elder (e.g., using terms like “Beloved”). -
Readability: Thoughts are broken into short, readable paragraphs rather than walls of text.

4. Moderation & Controls

- **Persona Persistence:** The system prompt is engineered to resist “jailbreaking” attempts, ensuring the AI maintains its Christian values even in complex scenarios.
 - **External API Safety:** Leverages the safety filters provided by **OpenRouter** and the underlying LLM provider to block harmful or inappropriate content.
 - **In-Memory History:** Session history is handled per-user and is not stored permanently, maintaining user privacy.
-

5. Update Process

- **Codebase Updates:** Managed via git, with deployments typically pushed to **Hugging Face Spaces**.
 - **Prompt Engineering:** The `SYSTEM_PROMPT` is the primary lever for adjusting theological alignment and behavior. Updates are applied in `main.py`.
 - **Dependency Management:** Controlled via `requirements.txt` to ensure environment stability.
-

6. Limitations

- **Hallucinations:** Like all LLMs, Theo may occasionally generate facts or scripts that require verification.
- **Internet Dependency:** Requires an active connection to OpenRouter and DuckDuckGo to function.
- **Session Memory:** Chat history is stored in-memory; refreshing the page or restarting the server clears the current session journey (intentionally, to ensure privacy and freshness).
- **Theological Breadth:** While knowledgeable, Theo is not a replacement for a personal Pastor or professional counseling for severe mental health crises.
